11:00 EDW team identified that the BO reports are not refreshing and failing with below error

11:48 Network team was involved who confirmed that multiple work orders were raised from Data Platform (Amnomics) team to delete the private end points/ DNS entries - dtaeunprodfilesapbo01.privatelink.core.windows.net (10.150.140.161, 10.150.140.162, 10.150.140.156, 10.150.140.158,

10.150.140.159, 10.150.140.157). Network team had deleted the BO storage account **dtaeunprodfilesapbo01 which caused the issue.**

12:00: We also identified that there was a further request of 8 Pre-prod storage accounts which were deleted by the Network team in Infoblox, however, it was confirmed that there is no impact due to this action. The Data Platform SME was brought in to understand the process followed in deletion activity of these private endpoints/ storage accounts.

12:10: We concluded that the deletion of private end points/ DNS entries should be performed within Azure Cloud and there is no requirement to take any actions in Infoblox. Hence, the request should have been assigned to Cloud Ops team and not Cloud Network

12:25: Action agreed to revisit the process and hold the cleanup activity until the process is streamlined and the teams are aware of it.

3. Incident Resolution

Services were restored by reinstating the DNS entry within Infoblox.

4. Root Cause

Root cause is attributed to the deletion of the storage account responsible for the network connectivity between SAP BO Universe and Cloud Platform due to a process gap during the housekeeping activity.

Context:

In accordance with industry standards, stale IPs associated with private endpoint security entries must be removed from the Azure cloud.

On 05/03, the Data Platform (Amnomics) team had initiated a work order 1543299 in Remedy Helix as part of a cleanup activity aimed at removing only the stale IPs/private endpoints specified in the request, which can be reused from the Azure storage account. This task was assigned to the "Cloud Network DevOps" team, which proceeded without conducting a thorough analysis or impact assessment and deleted the DNS entry as they have access to DNS entry only (which hosts the private endpoints) responsible for the connection between SAP BO Universe and the storage account on 10/03 around 08:35.

Despite the deletion of the DNS entry, DNS caching at the SAP BO application level allowed reports to refresh normally until 10:30. However, by 11:00, the reports failed to refresh, triggering an alert about a scheduled report refresh failure in the BO application. Upon reviewing the logs, an error indicating "network path not found" was identified and MIM was invoked, and the necessary product teams were engaged. The Cloud Operation/Exponence team recreated the DNS entry for the BO storage account (dtaeunprodfilesapbo01) using the Muziris Portal and restored the connection between the SAP BO Universe and the Azure cloud.

Ideally, this work order should have been assigned to the "Cloud Operation/Exponence" team for deletion, as they would have conducted the appropriate impact assessment regarding the storage account's role in SAP BO reports and taken necessary actions accordingly.

It has been agreed to have an exercise performed between Data platform & Cloud Ops before identifying the stale IPs/private endpoints entries and then proceed with change process for the deletion of those identified entries.

5.1. Observability –

The issue was identified with a mail alert at 11:00 stating the scheduled report refresh failed in the BO application to EDW team, who checked the logs and observed the error as network path not found. Even though the DNS entry was deleted around 08:35, DNS caching at the SAP BO application level allowed reports to refresh normally until 10:30. As we have the required alert at the application layer, and it is working as expected. It was agreed that no further alerts would be required.

5.2. Technical Challenges -

The incident recovery faced no challenges, but the Data Platform team will revisit the housekeeping process for stale IPs and private endpoints.

5.3. MIM involvement & impact assessment -

MIM was engaged immediately after EDW confirmed the connection loss between SAP BO Universe and the storage account. Service Leads from all impacted portfolios were immediately involved, and the impact was reconfirmed.

5.4. Incident handling/ stakeholder management –

There were no concerns in managing the incident as all the required stakeholders, including the engineers of Cloud Network DevOps, Cloud Exponence and Data Platform were actively involved, and the recovery was prioritized.

5.5. Business Communication –

The Service Lead sent both the new and resolved communication together to all the stakeholders across the impacted portfolios, since the issue was identified and resolved quickly.

5.6. Supplier Engagement –

There was no supplier engagement in this incident.

Mitigation Actions:

	≡ Action	👤 Owner	📅 Due date	≡ Remarks/ Updates	🏷️ Action Category
1	Data platform team to review the process for housekeeping the storage accounts	+ Patel, Bijal	Fri, Mar 2...	Data platform & Cloud Ops to work together and identify the stale IPs/private endpoints and then proceed with change process for the deletion of those entries	Problem Avoidance
2	Refrain from doing changes in system configuration (addition, modification, or removal) with work orders	+ George, Emmanuel Balaji + Srinivasan + Somasundaram, Priyadharshini	Fri, Mar 2...	System configuration changes are to be made with change requests only by both Network cloud ops and cloud experience teams. Teams to work with change management and agree on the process	Problem Avoidance
3					

Please refer to [Major_Significant and Key Incident Tracker 16th O...](#) for progress updates on Mitigations.
